that this would be a significant contribution to assist industries across the state. Many of you perhaps are familiar with that program. \$72,358 goes to the Institute of Agriculture in Natural Resources and it deals specifically with the program of conservation tillage and water management programs and this was the first priority in their case. There is another important program, \$125,000, that provides the funding for a residency program in Lincoln Medical Education Foundation. This was started some years ago. Initially it was funded with grants and some federal funds. There is still substantial grants or contributions that are made locally for this program. It costs far in excess of the \$125,000 but the significant part on this residency program for me is the high number of students who have participated in this particular family practice residency who chose to practice in Nebraska and the great majority of those are not in Lincoln and Omaha but outstate. In addition, the other items that would be specifically funded was an additional \$75,000 at the University of Nebraska at Lincoln. It is specifically for library services, additional employees. Currently the library has for the last year or so, and you can I imagine check with the Pages, has not been able to remain open the hours that they used to because of a shortage of funding. I think almost everyone understands that libraries are the gut and bolts of an educational system. Access to students of library facilities is all important. There is \$50,000 for some salary improvement for some faculty at the College of Law. This was not brought to us by the University in their request but was essentially promoted by a number of attorneys around the state that felt that this was important to retain some of the high quality staff that the Law College has. There is \$121,600 that goes to the Institute of Agriculture, increases the funding support in the area of information technology. There is \$100,000 for the University of Omaha to increase support again for academic computing and again you can't overemphasize the importance of adequate academic computing capabilities for students. Then the other part would be \$110,000 for the University of Nebraska in Omaha which would be increased permanent full time faculty staffing at the Business Administration in Mathematics and Computer Science, again directly related to
